

ABSTRACT

5       The present invention provides a polymerizable  
composition comprising (a) an alicyclic alkane having at  
least one oxetanyl group and at least one epoxy group  
within the same molecule and (b) a compound capable of  
initiating cationic polymerization under irradiation of  
an active energy ray and/or under heat exhibits high  
activity in the photo- or heat-cationic ring-opening  
10       polymerization exhibiting high activity, e.g., rapid  
polymerizability, rapid curability, under irradiation of  
an active energy ray and/or under heat. The present  
invention also provides a polymerization product thereof.
